Calder offer a wide range of high pressure pump packages incorporating Hammelmann pumps for the chemical, oil and gas industries. Visit our website.

www.calderltd.com
**Exclusive sealing system**

**Labyrinth seal**

This seal design which is absolutely unique to Hammelmann enables safe, reliable, continuous duty operation at pressures up to 3800 bar.

The high pressure seal is formed within the minute cylindrical gap between the plunger and the labyrinth insert. The medium pressure is continuously reduced along the sealing surface. A minimum amount of high pressure leakage serving as lubricant is returned to the pump suction chamber.

The plunger connection to the power end is self centering thereby drastically reducing sideways forces. This design ensures that there is virtually no contact between the plunger and the labyrinth insert resulting in extremely low component wear.

When the pump unit is shut down the medium remains in the cylindrical gap so that a re-start, even after an extended shut down period is assured.

Wear at the high pressure seal components does not lead to an abrupt breakdown of the pump but rather a gradual decrease in the flow rate. If the pump is driven in a control loop the r.p.m. of the driver will increase in direct proportion to component wear.

We manufacture extremely compact Triplex and Quintuplex pump units for injection of Methanol, LDHI, Glycol and a range of inhibitors.

Hammelmann high pressure pump units in the pressure range up to 15,000 psi (1035 bar) have developed into the standard choice for offshore methanol injection applications with a reputation for extreme reliability and minimal maintenance requirements.
Hammelmann pumps produce maximum performance from a minimal footprint which is the result of combining a compact integral speed reduction gear end with the concept of a vertical configuration.

The vertical configuration channels oscillating forces directly downwards into the base structure. Unwanted lateral oscillations as produced by horizontal pumps do not occur.

The integral speed reducer with twin helical gears arranged in a herring bone configuration ensures smooth running and even power transmission without axially loading the bearings.

A selection of gear ratios is available to allow the optimal choice of driver. The compact construction eliminates the need for an external gear box and prevents rotary oscillation. Mechanical efficiency is in excess of 95%.

Extensive performance range

With both Triplex and Quintuplex pumps available we can supply a very extensive range of flow rates and operating pressures.

Power ratings
- up to 1000 HP
- up to 750 kW

Flow rates
- up to 600 gpm
- up to 2500 l/min

Operating pressures
- up to 55,000 psi
- up to 3800 bar

The series 5 pumps are conservatively rated for power with low plunger speeds ensuring limited wear of plungers and sealing elements.
Series 2 pumps employ the same precision engineered, field proven components as Hammelmann standard production pumps. They are extremely compact with low maintenance costs and high operational efficiency.

Moderate plunger speeds result in low plunger and sealing element wear characteristics.

**Units**

Our high pressure pump units can be supplied with electric motor, a choice of controls, safety valves and suction side/discharge side pulsation dampers.

**Maintenance**

Pump maintenance is carried out from above. Once the pump head is removed you have complete, uncomplicated access to all high pressure components.

**Pump head**

The total pressurised fluid product of the individual cylinders collects within a single high pressure discharge bore within the pump head valve block. The coaxial valve arrangement eliminates alternating stress within the valve block.

**Suction chamber**

The process fluid enters the pump via the suction chamber. This totally encloses the high pressure components in a protective barrier and prevents emission of medium to atmosphere.

**Seal monitoring**

The condition of the low pressure seals may be monitored by installing an optional seal monitoring system.

**Valves**

The suction valve (below) is a disc ring design incorporating a one piece suction and discharge valve seat.
In detail, Series 2 pumps employ the same precision engineered, field proven components as Hammelmann standard production pumps. They are extremely compact with low maintenance costs and high operational efficiency.

Our high pressure pump units can be supplied with electric motor, a choice of controls, safety valves and suction side/discharge side pulsation dampers.

Features

Series 5 pumps are built to the highest standards of safety and reliability. We can supply components from a wide range of materials to suit the pumped medium.

Our latest variation of this pump series is the Zero emission where the pumped fluid is hermetically sealed within the pump, preventing leakage to atmosphere during operation.

The series 5 pumps are conservatively rated for power with low plunger speeds ensuring limited wear of plungers and sealing elements.

Units

Your complete pump unit can be outfitted with suction and/or discharge pulsation dampers dimensioned, manufactured, tested and certified to your specification.

Bellows system

The bellows are the hermetic seals for the power end to prevent the intrusion of fluid or gas. They are available in FKM, H-NBR and PTFE.

Valves

To ensure that the pump construction is appropriate for the pumped medium we have a number of alternative valve designs available. In the example shown below the suction and discharge valves are conical. The suction and discharge valve seats are combined in one component.

Gas tight design

The intermediate chamber of the pump can be outfitted with gas tight covers which provide a seal to atmosphere. The chamber is then charged with inert gas.

This design ensures that no fluids, vapours or gases can escape to atmosphere via a worn plunger seal.

1 = Priming valve
2 = Safety valve
3 = Pressure regulating valve

Seal monitoring system

TA-Luft (Clean Air) certified to VDI 2440
This seal design which is absolutely unique to Hammelmann enables safe, reliable, continuous duty operation at pressures up to 3800 bar. The high pressure seal is formed within the minute cylindrical gap between the plunger and the labyrinth insert. The medium pressure is continuously reduced along the sealing surface. A minimum amount of high pressure leakage serving as lubricant is returned to the pump suction chamber.

When the pump unit is shut down, the medium remains in the cylindrical gap even after an extended period is assured. Wear at the high pressure components does not occur abruptly but rather a gradual decrease of the leakage is necessary. Machine control loop the r.p.m. of the drive will increase in order to avoid the plunger a result of excess component wear. When the pump unit is started up, the medium remains in the cylindrical gap even after an extended period is assured.
